

Ten Facts About The Sun

William Loyal Warren

14 Fun Facts About the Sun: A 15-Minute Book Jeannie Meekins, Our sun is an average star in our galaxy. It is a sphere of burning gas that provides light and heat. It makes our plants grow and allows them to turn carbon dioxide into breathable oxygen. If our sun were to shine a little less or a little more brightly, life as we knew it would not exist. A drop of less than 2% of the sun's energy output would turn Earth into an ice-covered planet. So how much do you know about this glowing sphere that controls our world. Can you answer these questions: What is the sun made up of? How long does it take the sun to orbit the center of our galaxy? How many layers of atmosphere does the sun have? What are solar winds and what do they do to Earth? What impact do solar flares have on Earth? Find out more about the Sun and amaze your family and friends with these fun facts. All measurements in American and metric. The Educational Version has activities that meet Common Core Curriculum Standards. Planets: 100 Illustrated Fun Facts Katy Gleit, 2014-10-21 This picture book is a great teaching tool for your little one and for you. It is like illustrated encyclopedia of planets for every kid. The pictures are clear and the colors are nice. If you are ready to challenge your mind and prove to everyone that you are the king of planets knowledge, then pick up this book and prepare for the ultimate trivia experience. Test your fact knowledge as you look at some of the most captivating facts about planets of our Sun's System. Do you know that? The nine planets are the most important members of the Sun's System. In order of distance from the Sun, they are: Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus, Neptune and Pluto. Mercury, Venus, Earth and Mars, are small rocky bodies. Jupiter, Saturn, Uranus and Neptune are giants, made up mainly of gas. Pluto is tiny ball of rock and ice. The Sun is nearly ten times bigger across than Jupiter, and it could swallow more than a million Earths. Earth is bigger than four of the planets - nearby Venus, Mars and Mercury, and tiny distant Pluto. Jupiter is by far the largest of the planets and has more mass than all the other planets put together. Jupiter measure nearly 143 000 kilometers across, which is 11 times bigger than Earth. Even though Jupiter is so big, it takes less than 10 hours for it to spin round once: this means that its surface is spinning round at a speed of 45 000 km an hour. This is 30 times faster than Earth spins. Once it was thought that Saturn was the only planet that had rings around it because they were the only ones that can be seen through a telescope. Close-up photographs taken by the Voyager space probes have shown that the other three gas

giants - Jupiter, Uranus and Neptune - have rings too, but their rings are much thinner, narrower and darker than Saturn's. Ancient astronomers could only see five planets in the night sky until 1781. In this year was built a telescope powerful enough to spot Uranus. Uranus was the first of three new planets to be discovered after 1781. Neptune was discovered in 1846. Pluto was discovered in 1930. Saturn is surrounded by a set of bright, shining rings and when you look at the planet through a telescope it is very beautiful. Saturn is the lightest (least dense) of the planets. It is lighter even than water - if you could place it in a huge bowl of water, it would float. Pluto travels more than 7000 million kilometers away from the Sun. It takes nearly 248 Earth years to circle the Sun once. Mercury is the planet closest to the Sun. Mercury is the fastest-moving planet, whizzing round the Sun in just 88 days. Being close to the Sun, Mercury gets extremely hot. As you read this book over and over to your child it won't be long before they are the ones pointing to the picture and telling you what it is. The author Katy Gleit wrote this book for her own two grandchildren Dani and Deia: In *Planets: 100 Illustrated Fun Facts* your children are given a well-selected knowledge along with entertaining information about the planets of our Sun's System. In addition, a set of wonderful pictures show exactly what a planets looks like.

14 Fun Facts About the Kuiper Belt and the Oort Cloud Jeannie Meekins, It was once thought that our solar system ended at Saturn. Then the first telescopes revealed Uranus and Neptune. Differences in the calculations of the gravity of these giants set off another search and Pluto was discovered. Pluto was then thought to be the last planet of our solar system. Beyond it was empty space - until astronomers started looking at comets. Huge balls of ice, zipping through the solar system, past the planets, around the sun and back out again. Where did they come from? Where did they go? And what made them come back? That's when scientists discovered the Kuiper Belt and the Oort Cloud. Read this book and find out: How many types of comets are there? What formed the Kuiper Belt? How big is the Kuiper Belt? What is the Oort Cloud? How big is the Oort Cloud? How long does it take sunlight to reach the Oort Cloud? Find out the answers to these questions and more and amaze your family and friends with these fun facts. Ages 8 and up. Secrets of Solar System M. Sharma, Our Solar System constitutes of Sun in the center, and they are the nine planets, more than 60 moons are there, millions of rocky meteors, and billions of frozen comets. Every planet of the solar system lying in its orbit revolves around the Sun. A tip of Sun's rays even can create disaster to an extent of 160-kilometer stretch. Few mountains found on the Earth, actually are the pieces of the planet Mars. One light year is equivalent to 10,000 billion kilometers. Our solar system is shifting towards Hercules constellation of stars at a speed of 19.3 kilometers per second. The sky of the earth is blue; the sky of Mars is pinkish-orange because of the dust present in the atmosphere. For thousands of years, the man had no knowledge about the solar system. He had believed that earth alone was the center point of the universe. Nicolas Copernicus, Galileo Galilee, Johannes Kepler, and Isaac Newton well-known astronomers by studying the speed and movements of the planets have today brought to our knowledge that Sun is the center point of the solar system. Among the planets of the solar system only Venus and mercury are not the planets who have their own moons, rather earth one satellite is the moon, Mars has 2 moons, Jupiter has 63 moons, Saturn has 60, Uranus has 27 and Neptune has 13 moons. The energy that reaches from the Sun to the earth, reaches an electric charge of 1.37-kilowatt electricity per meter.
