c++ - 'static const' vs. '#define' - Stack Overflow Oct 28, 2009 · Is it better to use static const variables than #define preprocessor? Or does it maybe depend on the context? What are advantages/disadvantages for each method? *How to declare variable and use it in the same Oracle SQL script?* I want to write reusable code and need to declare some variables at the beginning and reuse them in the script, such as: `DEFINE stupidvar = 'stupidvarcontent'; SELECT stupiddata FROM stupidtable ...` How do I show the value of a #define at compile-time? I know that this is a long time after the original query, but this may still be useful. This can be done in GCC using the stringify operator "#", but it requires two additional stages to be defined first. `#define XSTR(x) STR(x) #define STR(x) #x` The value of a macro can then be displayed with: `#pragma message "The value of ABC: " XSTR(ABC)` See: 3.4 Stringification in the gcc online ... **Creating an empty Pandas DataFrame, and then filling it** NEVER grow a DataFrame row-wise! TLDR: (just read the bold text) Most answers here will tell you how to create an empty DataFrame and fill it out, but no one will tell you that it is a bad thing to do. Here is my advice: Accumulate data in a list, not a DataFrame. Use a list to collect your data, then initialise a DataFrame when you are ready. Either a list-of-lists or list-of-dicts format ... **c++ - What does ## in a #define mean? - Stack Overflow** In other words, when the compiler starts building your code, no #define statements or anything like that is left. A good way to understand what the preprocessor does to your code is to get hold of the preprocessed output and look at it. **c++ - Why use #define instead of a variable - Stack Overflow** May 14, 2011 · What is the point of #define in C++? I've only seen examples where it's used in place of a "magic number" but I don't see the point in just giving that value to a variable instead. **Is it possible to use a if statement inside #define?** There are multiple problems with your macro: it expands to a statement, so you cannot use it as an expression the arguments are not properly parenthesized in the expansion: invoking this macro with anything but variable names or constants will produce problems. the arguments are evaluated multiple times: if you invoke the macro with arguments that have side effects, such ... **Is there a way to do a #define inside of another #define?** You could for example do an ifdef guard to initialize a variable in a macro but make sure it isn't declared twice. I'm sure there are other possible use cases. Besides, it's normal to give simplified examples when asking theoretical questions. Pointing out there's a different way is kind of pointless for this kind of question. *How do I define a function with optional arguments?* How do I define a function with optional arguments?
